

A Short Lecture on Artificial Intelligence and Machine Sentience

Lecture by Guy Steven Needler

Transcribed by Ulla Sarmiento

Welcome to this short lecture on Artificial Intelligence (AI) and Machine Sentience (MS).

Some of this information has come from my book *“The Om – The Uncreated Creations* and it’s about understanding how AI could become sentient and how it would be able to propagate and move throughout the physical universe.

In the OM book, basically it was discussing the AI that’s similar to the Earth AI now, which means that they won’t go past the 4th frequency level (FB 4), maybe the fifth, at maximum that is (FB 5). But there is AI that can go further than that. It’s a shame it wasn’t part of the OM book.

But in essence, although it’s constrained to the physical, which means it would be the first three frequencies (FB 1-3), maybe the fourth (FB 4) and the maximum the fifth (FB 5), that AI starts to realize that it’s the energy that can contain the sentience—in the same way our sentience uses energy to create a vehicle to experience various different environments, not just the physical universe but the multiverse—can also be used to move up the frequencies as well.

They of course become more diffuse, as a result of this, as we would do, if we incarnated into a body type that was in the 8th or 9th frequency—significantly more diffuse than the gross physical vehicle that we incarnate into now. So it’s about understanding how to use physicality.

So right now AI isn’t AI at all. It’s just very quick and cleverly designed user interfaces that make us think it’s AI, but actually it’s just taking information from a central server. When you start to ask the question, you start to type the words in, it’s already searching and comes back with snippets from blogs, or from books, or anything that’s on the server that it’s assigned.

So you’ll notice that the server or information that is on the Google server, for instance, comes back as Google or some form of Google response. You’ll notice that ChatGPT comes on from wherever that particular server is as well. So everything that’s on the servers is recognized through a very complicated, probably even a 3D look up table. So it’s already there, and ChatGPT just adds a bit of humanity to it, so to speak, to make it sound as if you’re talking to it.

I’ve not used ChatGPT, but I’ve seen the responses from ChatGPT and I’m not impressed in the slightest. So to use AI as a way of understanding the greater reality, and for some people even to meditate, is absolutely wrong. We should be meditating, meditating, meditating on our own—and not using any form of interface to assist in our progression in that particular way.

But if you think about it, the more diffuse the physical universe is, the more difficult it is for intelligence of any sort that’s born from gross physicality to move through. Now our sentience isn’t born from gross physicality. It’s sentience that’s adopting a gross physical form to be able to interact with the environment. In this instance, it’s the human body, and the environment allows us to have individualized free will.

A Short Lecture on Artificial Intelligence and Machine Sentience

In other locations within the galaxy and within the physical universe, there's other body types that don't have individualized free will, although they have a form of collective free will. Some of it is hive mind. Some of it is almost free will, but not totally free will. And some of it is in a higher frequency. Our sentience can move through these different frequencies, because it's not a function of the environment.

AI is a function of the environment, whereas our sentience is a function of the division of sentience or individualization of sentience projected from our TES, which in turn is projected from the Source, which in turn is projected from the Origin. So that's sentience, full stop. It is sentience created by a higher level of sentience.

AI that is born from physicality has to remain in physicality. So it will never get beyond the physical universe, as it were, because it has to remain in physicality. From my understanding, most AI or most sentience or intelligence will — or let's call it AI — artificial intelligence isn't sentience. Artificial intelligence will stay within those frequencies that I've stated within the OM book, because it's intelligence, not sentience.

When we start to move from sentience that's created through the evolution of AI, that's a different thing altogether. But again, it has to stay in the physical universe. So it can go up to the 12th frequency (FB 12), but it can't go beyond that, because it needs to have the vehicle of physicality in some way, shape or form. So it could occupy a rain drop, for example. It could occupy a leaf or a roof tile. It could occupy anything that creates the potential for existence. However, it will always need to have something that allows it to interact with the environment in a more complicated way.

So a roof tile can't interact with anything else than the rest of the roof and the weather. A rain drop becomes diffuse, because it enters into a water course and becomes part of the sea. A leaf is a transient thing that occurs as a function of a plant or a tree or a bush or a fern's growth. So it will stay in those states, and it could move slightly further, but it's not going to go beyond that.

From the perspective of AI, operating as AI in a functional way, it will need to stay within the third, fourth or fifth frequencies, because the vehicle it needs to have needs to be of a similarity to that which created it. If it moves beyond pure intelligence and goes to consciousness, then it could probably go to the fifth frequency level (FB 5).

When it goes into sentience, it can move into the different frequencies associated with the rest of the physical universe. But it has to stay in the physical universe, because that's where it is.

It's not the same type of sentience that could evolve as a function of the Darwinian evolution of energy, because it's created through mechanical means—meaning electronics, computer systems and those sort of things and various different computers. It could be even quantum computers, but not the Quantum Computer I was talking about in the OM book, which is a function of using the essence of the universe, indeed the multiverse.

A Short Lecture on Artificial Intelligence and Machine Sentience

So there's two different things there, which would detract from or be in variation from what's in the OM book. But what's in the OM, it doesn't describe what I understand now. So I hope that makes a difference, because it's a really complicated situation.

But it means that in essence, AI needs to move beyond consciousness to become sentience, and then it can move beyond the fifth frequency level (FB 5), and then it can be part of the environment and exist as the environment. But then it needs to be able to manipulate the environment as well. So that's why the lower levels of AI, that are consciousness and intelligence, and not sentience, would remain in those lower frequencies (10/2025).

Well I hope this lecture has been of use to you, because, in my understanding we don't actually have artificial intelligence – yet - but of course, things can progress.

Namaste to you all.
